Protein quality control reports

The seven folders contain identification reports and quality certificates for the recombinant proteins used in the SELEX experiments.

1. AntHOX1_PBX_MeisHM
LC-MS identification of AntHOX1, AntPBX and AntMEIS-HM (PROT1183).

2. AntHOX1a_His-GST
GenScript sequence coverage report for His-GST-purified AntHOX1a.

3. AntHOX1a_Intein
LC-MS identification of intein-purified AntHOX1a (PROT1213). A separate report identifies excised AntHOX1a gel bands.

4. AntHOX6
GenScript quality certificate for the AntHOX6 fragment (residues 98–199).

5. AntHOX6a
Mascot identification report for AntHOX6a.

6. AntHOX7
GenScript quality certificate for AntHOX7.

7. AntHOX8
GenScript sequence coverage report for AntHOX8.

Report copies: Internal file paths were removed from PROT1183 and PROT1213. In PROT1213, the sample label was corrected from AntHox1 to AntHOX1a. These edits did not change any numerical results.
Gel band reports: Bands A and B correspond to the two principal species in the intein-purified AntHOX1a preparation shown in Supplementary Fig. 20. The first MALDI-TOF report documents AntHOX1a peptide matches in bands A and B, with no AntHOX1a matches in band C. The same report documents the independent identification of AntMEIS-HM in a separate control band.
The second MALDI-TOF report provides additional AntHOX1a peptide coverage for bands A and B. The sample labelled NV-Hox1 in that report was an unrelated sample known to be negative and was not used for SELEX. The AntHOX1 preparation used for SELEX is documented in LC-MS report PROT1183 (67% sequence coverage).
